TITLE: Photographic noise and the signal/noise ratio of various photographic materials

SOURCE: Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, v. 8, no. 4, 1963, 284-292

TOPIC TAGS: photography, noise, photographic noise, signal/noise ratio, photographic material, MF-4 microphotometer, KMVL-1 quadratic millivoltmeter, M-95 microamperometer, Agfa photo plate, Ilford photo plate, photographic film, Mikrat film, Mikrat 200 film, Mikrat 300 film

ABSTRACT: This work was carried out in order to measure the intensity of noise and the signal/noise ratio of various photographic materials. It was assumed that noise intensity was related to the granularity of material, i.e., the number of the exposed grains in a uniformly illuminated section of the film. The experimental assembly consisted of a modernized MF-4 microphotometer, a KMVL-1 quadratic millivoltmeter, and a M-95 microamperometer. Agfa plates and Ilford plates used

Card 1/2

ACCESSION NR: AP3003607

in astronomy and spectroscopy, and various types of films (including Mikrat films) were studied. It was established that: 1) the noise intensity showed a 3- to 4-fold variation during the transition from fine- to coarse-grained materials; 2) the strongest noise variation was observed in the negative materials; 3) noise intensity of fine-grained negative materials differed little from that of positive materials; 4) the signal/noise ratio at a given film-blackening density depended strongly on the intensity of the fog. For this reason some materials of equal granularity had different signal/noise ratios. Orig. art. has: 3 tables and 6 figures.

TITLE: Increase in the sensitivity of photographic film by post-exposure for use in photographing artificial earth satellites.

SOURCE: Pulkovo. Astron. observ. Izvestiya, v. 23, no. 2(173), 1963, 167-174.

TOPIC TAGS: artificial earth satellite, satellite photography, photography, panchromatic film, post-exposure, film sensitivity, photographic image

ABSTRACT: Three highly sensitive panchromatic films were investigated in a study of the effectiveness of prolonged additional post-exposure following an initial exposure of about 0.01-0.05 second. The objective was to enhance the sensitivity of film used in photographing artificial earth satellites. The subcenters of the latent image formed during the brief initial exposure, that is, the particles of metallic silver too small for direct development, will increase to the critical size of latent image centers under the influence of the light of additional post-exposure. Additional uniform post-exposure of negatives by weak scattered light for 3 to 5 minutes yields an appreciable increase in the photographic effect. The effect is particularly great when the film is not developed to maximum γ .

Card 1/2

ACCESSION NR: AT4012208

However, even satellite observation film developed almost to γ max is enhanced in sensitivity by 60-80%. The corresponding increase in maximum stellar magnitude of the observed satellite of $0^m.5-0^m.6$ is in many cases of great importance. The density of the background caused by the additional post-exposure should not exceed 0.1, and the contrast coefficient γ remains virtually unchanged. Orig. art. has: 2 figures and 9 tables.

AUTHOR TEPLOV, I.B., JUR'EV, B.A., MARKELOVA, T.N. PA - 2036
TITLE The Angular Distribution of the Products of the Reaction $S^{32}(d,p)S^{33}$.
(Russian)
PERIODICAL Zhurnal Eksperimental'noi i Teoret.Fiziki, 1957, Vol 32, Nr 1,
pp 165-166 (U.S.S.R.)
Received 3/1957 Reviewed 3/1957

ABSTRACT At present the reactions of the type (d,p) have already been investigated for many isotopes of light nuclei. However, in the case of most of the investigated nuclei (with the exception of the very lightest) experiments were carried out only at a value of the energy of the inciding particles. At the same time the investigation of the form of the angular distributions of the products of such reactions at different energy values of the impinging deuterons is of interest for the more precise description of the theory of the stripping reaction. Therefore the authors determined the angular distributions of these protons which are produced on the occasion of the reaction $S^{34}(d,p)S^{33}$ at deuteron energies of 1,8 and 3,8 MeV. The electrons accelerated with a 72 cm cyclotron bombarded a sulphur target (of 1 micron thickness) which was applied to leaf-gold. The protons produced in connection with the reaction were recorded by nuclear plates.
Angular distributions were determined for two groups of protons p_0 and p_1 , which correspond to the creation of a nucleus (in the end

Card 1/3

PA - 2036

The Angular Distribution of the Products of the Reaction $S^{32}(d,p)S^{33}$.

state, in the ground state, and in the first excited state). The experimental results obtained by the authors are shown in diagrams. For reasons of comparison these diagrams contain also the corresponding theoretical curves.

The theoretical curves determine the position of the main maximum (i.e. of the maximum in the case of small angles) well in the angular distribution of the proton group p_1 .

In the angular distribution of the group p_0 the experimentally found maximum was somewhat broader than the maximum computed theoretically, and besides it is displaced in the direction of smaller angles. This broadening of the peak and its displacement are considerably more marked in the case of a deuteron energy of 1,8 MeV than for 3,8 MeV.

A characteristic peculiarity of the angular distributions obtained here is the existence of comparatively high maxima. These secondary maxima increase with a decrease of the energy of the incident deuterons. Also in the angular distribution for the group p_1 something similar may be observed.

When explaining the peculiarities of the experimental angular distributions obtained here, it is necessary to take also Coulomb's interaction into account, because the effective Coulomb barrier of the S^{32} nucleus amounts to 5,1 MeV for deuterons. However, con-

Card 2/3

PA - 2036

The Angular Distribution of the Products of the Reaction $S^{32}(d,p)S^{33}$.

sideration of Coulomb interaction displaces the main maximum towards larger angles and causes no noticeably secondary maxima. Better agreement is apparently obtained if not only Coulomb's interaction but also nuclear interaction of the emitted proton with the remaining nucleus is taken into account.

TITLE: Study of 1-kev charged particle streams by Kosmos-15

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 4, 1965, 749-751

TOPIC TAGS: charged particle measurement, satellite/Kosmos 15

ABSTRACT: A spherical electrostatic analyzer, adjusted to 1-kev electron energies and containing a +12 v grid at its opening to protect the instrument compartment from positive ion bombardment, was installed on "Kosmos-15", launched 22 April 1963. The analyzer's maximum sensitivity was 20 mv, which corresponded to $\sim 1.2 \cdot 10^7$ particles/cm² sec kev. The measurement program included four stages, the first two stages consisting in recording 1-kev electrons, the third stage — 1-kev positive ions, while during the fourth stage the spheres made contact with the satellite body. The cycle was thereafter repeated. Measurement results (see Fig. 1 of Enclosure) indicated the presence of two maxima at identical latitudes on either side

MARKELOVA, V. F.

✓ Synthesis of glutamine in heart muscles. S. R. Mardashev and V. F. Markelova (1st Moscow Med. Inst.). *Ukrain. Biokhim. Zhur.* 27, 248-54 (1956) (in Russian).
MD Male rabbits were decapitated and their hearts removed and stored in ice. The pericardial tissue and large blood vessels were removed, the residue cut into small pieces, macerated in a phosphate buffer of pH 7.4 at 0°, and homogenized for 4 min. in a Waring Blender. The final homogenate contained not less than 300 mg. of crude muscle tissue per ml. The sarcosomes synthesized glutamine by the process of glutamic acid amidization. The addition of adenosine triphosphate to the isolated sarcosomes raised the glutamine synthesizing activity to a degree equal to that of the original homogenate. The nuclear fraction and supernatant fluid were free from the enzymic system synthesizing glutamine.

MARKELOVA-V.F.

The synthesis of glutamohydroxamic acid in the muscles of the heart. V. F. Markelova (1st Moscow Med. Inst.), *Biohimiya* 20, 110-113 (1955).—Rabbits were killed and their hearts rapidly removed and placed on ice. The pericardium and the large vessels were removed, and the heart muscles washed with pH 7.4 phosphate buffer soln., comminuted, homogenized, and fraction-centrifuged into (1) a fraction of nuclei, contg. monofibrillar and tissue fragments; (2) a fraction of sarcosomes; and (3) the supernatant fluid. Hydroxamic acid was detd. by the method of Lipmann and Tuttle (*C.A.* 39, 5210^o). Exptl. tests (3 ml.) contained the heart-muscle homogenate or one of the centrifugofractions, glutamine and hydroxylamine, Mg^{++} or Mn^{++} , and adenosinetriphosphate (ATP). Control tests contained the boiled inactivated homogenate or the centrifugofractions. Both sets of tests were incubated in a Warburg app. at 37° for 1 hr. with shaking. To each tube was then added 1 ml. *N*HCl, 12% CCl_3CO_2H , and 5% $FeCl_3$ in 0.01*N* HCl, the soln. was filtered, and photometric detns. were made and compared with those of the controls, which were first appropriately treated as described in the text. Lipmann-Tuttle standards were used. A transferase, which activates the synthesis of hydroxamic acid from glutamine and hydroxylamine, exists in the heart muscle of the rabbit. This enzyme was found in the supernatant fraction of the heart-muscle homogenate. The synthesis takes place only in the presence of Mn^{++} or of Mg^{++} ions, the former being most effective. The synthesis progresses with the same intensity under aerobic or anaerobic conditions. The addn. of ATP is of no benefit. B. S. Levin

Title : The Amount of Vitamin D₁₂ in the Blood of Dogs in Anemias Induced by Formation of a Small Ventricle According to Klementsevich-Heidenhein.

Orig Pub : Byul. eksperim. biol. i med., 1958, 45, No 1, 32-38

Abstract : In 3 dogs (D) 40-60 days after surgery of formation of a small ventricle, the amount of Hb decreased on the average by 11.8%, erythrocytes (E) by 1,180,000; the number of leucocytes (L) increased by 3000. The content of vitamin D₁₂ in the blood of two D did not decrease, in the third it decreased by 3.2 times (in it a considerable irritation of skin with gastric juice was observed). To all D, 15 gamma of D₁₂ was introduced on the 3rd day for

Card 1/2

USSR/Human and Animal Physiology (Normal and Pathological) T
Blood. Blood Diseases.

Abs Jour : Ref Zhur Biol., No 6, 1959, 26493

the duration of 4 weeks. After the first two introductions, in the control D the amount of Hb and E increased and was sustained at this level for 4-6 days; in D which underwent surgery (except in 1 sick D) the amount of Hb and E also increased but did not reach preoperative level. The return to the original level was twice observed in then later than in those in the control. This is, apparently, explained by a disturbance of the process of deposition and utilization of D₁₂. After partial denervation of the stomach in D after 40-60 days, insignificant hyperchronic anemia appeared, which was not accompanied by decrease of D₁₂ content in blood. Apparently, the development of anemia in this case does not depend on disturbance of D₁₂ assimilation. -- E.R. Paley

TITLE : The European Frit-fly, a Pest of Corn

ORIG. PUB.: S. Kh. Bashkirin, 1957, No.10, 37-39

ABSTRACT : When the corn grows rapidly the larvae of the European frit-fly are pressed upwards and driven out. The infestation of the 10-21-24 day old plants was 100-36-2%. The affected plants usually do not perish. The types of damage are described. The plants were affected when sown on 5, 15, 25 May, on 5 June when the flight of the first generation of the fly ceased and on 15 June (the flight of the second generation) at 13.6%.

inside. The caterpillars of the fourth and fifth generations of the rose L roll one or more leaves into cigarette-shaped tubes (less often they build porous "nests"), whereas the caterpillars of the hawthorn L fold the leaves in half along the central rib. Eighty percent of the 15-day-old rose L caterpillars were located in the lower part of the treetop (more to its interior side); the 38-day-old, in all parts equally. Seventy-five percent of the 38-day-old caterpillars of the hawthorn L were located in the exterior parts of the treetop, 43% of them in the middle part. The chemical struggle against the caterpillars is more effective in the period of their massive parturition (during the phase of bud burgeoning) with careful dusting of the entire

Fruit Gardens.

Orig Pub : Dokl. Mosk. s.-kh. akad. in. K.A. Timiryazeva,
1957, No 29, 175-179

Abstract : The Timetocera ocellana F. larvae destroy each
year 7-10% of the open apple buds in the Moscow
Oblast. 35% of the second and third generation
larvae winter under the dead bud scales, 30%
winter under the dried top of the fruit sac, and
24% of the larvae winter in the bark crevices.
The larvae mostly inhabit the exterior part of
the crown; they pupate (in cocoons) in bark
crevices, in the forks of branches and so forth.

MARKES, R.

Kinetics of the extraction of low-molecular substances from polycaprolactam. J. Rudolf Markes (Silon, Planá n. L., Czech.). *Chem. průmysl* 9, 497-500 (1956).—The kinetics of extrn. of caprolactam (I), and low-mol.-wt. oligomers of I from polycaprolactam fibers (II) of 8.3-150 μ in diam., contg. 10.1, and 11.2% I, with aq. solns. of 0-4% I at 40-100° was investigated. The exptl. estd. mean reduced concn. of I in II (\bar{N}) agrees well with the formula $\bar{N} = M \exp(-t)$, the latter being derived in analogy to the process of continuous transfer of heat with the presumption that the rate of extrn. is detd. by the diffusion of the soln. of I through II. The equil. concn. of I was independent of the diam. of II, and from exptl. results the diffusion coeff. was calcd. for temps. 40-100°.

Engineer Lieutenant-Colonel

TITLE: The Purification of Oil

PERIODICAL: Tankist, 1958, Nr 6, pp 45-47 (USSR)

ABSTRACT: The authors state that lubricating oils used in internal combustion engines lose their original qualities during the working process. These changes are caused by an accumulation of impurities and also by the influence of high temperatures. The sediments in the motor oil are composed of oil - 80-85 %, water - 5-10 %, fuel - 3-5 %, ashes - 3-4% and products of oxidation of oil and fuel. Admixtures of a mechanical nature are most dangerous for the machine working parts. They might disturb the normal operation of the engine by accelerating wear of working parts. The lubricating system of the B-2 type engines includes filters of a rough-clean

Card 1/3

SOV/175-58-6-30/41

The Purification of Oil

and fine-clean types. The first is able to stop mechanical particles of 75 microns, the others - of 60 microns. The oil cleaning may also be done by centrifuging. Centrifugal separators may have either hydraulic or mechanical drive. The first, mounted on a type DT-54 tractor, are used for cleaning oil in tractor engines. The second - for oil cleaning in vessels and stationary Diesel engines. Centrifugation is applied for the periodic cleaning of lubricating oil of tank engines. For this purpose, an NSM-2 type vertical centrifugal separator of uninterrupted drive is used. The arrangement of the separator is shown in the diagram (Figure 1). Prior to the cleaning operation, the oil must be heated to a temperature of 80 to 85°C. This is necessary to reduce its viscosity. The main parts of the separator (Figure 1) are centrifuge, electric motor, electric heater, two-stage pump, friction

Card 2/3

SOV/175-58-6-30/41

The Purification of Oil

coupling and base. Officers Pavlov and Borisov have produced a mobile oil cleaning unit shown in a drawing (Figure 2). It is in the form of a two-axle car. The entire oil separating equipment is mounted on the car. It includes a type "PN-28.5" d.c. electric motor of 2.2 kw capacity. Operation of the assembly is directed from a control panel shown on a drawing (Figure 3). Switches, a control bulb and a starter are mounted on the panel. There are 2 photographs and 1 sectional diagram.

TITLE: New specifications for lubricants"

SOURCE: Tekhnika i vooruzheniye, no. 1, 1966, 65

TOPIC TAGS: solid lubricant, lubricant property, lubricant viscosity & ~~GOST-4366-54 "S"~~
~~lubricant, GOST-4366-50 "US", "USs" lubricant~~

ABSTRACT: A brief review of new GOST-4366-64 Specifications for pressure and ordinary lubricants of "S" type is presented. The new synthetic lubricants of an improved consistency are put in use as substitutes for old "US" and "USs" trademark of GOST-4366-50 Specifications. It is stressed that they have a higher ultimate strength and a lower viscosity. The ultimate strength at 50°C is at least 1 g/sq cm for pressure lubricants and 2 g/sq cm for the ordinary type. The viscosity at zero degree is less than 1000 poises for pressure lubricants and does not exceed 2000 poises for the ordinary ones. The contents of alkali is less than 0.2% and of water lower than 2.5%. The contents of impurities does not exceed 0.3%. The new lubricants have good anticorrosive properties and are free of acids.

Title : Influence of Narcosis on Respiration and Cerebral Bicelectric Activity at Acute Stages of Asphyxiation and Restoration of Organic Functions.

Orig Pub : Patol. fiziologiya i eksperim. terapiya, 1957, 1, No 1, 19-25

Abstract : Deep ether narcosis was found to inhibit the compensatory excitatory phase of breathing (B); in cases of acute asphyxiation changes occur in breathing at three stages: slowing down of the rhythm, prolonged interruption, and terminal inhalation. Acute asphyxiation induced by strong ether narcosis, revealed delayed frequency, and reduced amplitude of slow waves on EEG. Cortical biocurrents disappeared at an earlier stage of asphyxiation

AUTHOR: Markevic, A. P.¹⁹ (Academician)(Kiev) 

TITLE: Principles and methods involved in the investigation of parasitological situations in connection with the organization of the complex struggle against parasitoses

SOURCE: Veterinarstvi, no. 9, 1965, 385-388

TOPIC TAGS: parasite, animal parasite, parasitology, health

ABSTRACT: The author notes that the first step in organizing the struggle against parasitic disease is a concrete plan for protecting the health of both man and domestic animals, as well as the destruction of parasites in the surrounding environment. This plan must be concerned not only with the eradication of disease, but with the removal of natural and social conditions which encourage the development of parasites. Systematic sanitary, zoohygienic, zotechnical, and agrotechnical measures which would create resistance, both specific and non-specific, in man and animals, must be included as an integral part of agricultural technology as a whole. Mass parasitic invasions can be reduced considerably by the development of proper zoohygienic conditions, feeding

Card 1/2

09010034

L 4532-66

ACCESSION NR: AP5023706

regimen, use of antibiotics, foods with antiparasitic effects, etc. Simple isolation of the young from infected carriers can help produce a healthy, highly productive population. The proper handling of water troughs, manure storage, pastures, human dwellings, and building of barns which are not accessible to flies and rodents are all an essential part of the program. Sucking parasites must be destroyed by mass prophylactic action. Farm dogs must be kept healthy, and wandering dogs and cats destroyed. There must be thorough disposal of manure, fecal matter, organic debris and cadavers. These goals can only be achieved when there is maximum cooperation between scientists and practical workers.
